

The Disperser

Fruit-eating bats play an indispensable role in seed dispersal and ultimately forest regeneration.

THE BRILLIANCE OF BATS

5 Important Roles of the Bat

The Educator

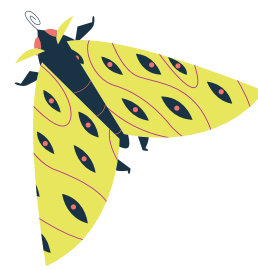

Bats are beautiful and complex creatures. Scientific research on bats provides us with extensive information on crucial subjects from disease defence to ecosystem functions.

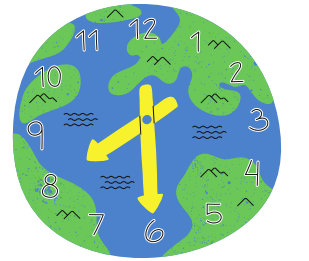

The Pollinator

Bats are relied upon by over 500 species of plant for pollination (think bananas, mangoes and agarve for tequila!)

The Pest Controller

Insectivorous bats species can consume thousands of insects each night. Not only do they keep pesky insect populations regulated but can also act as crop protectors as they keep bugs away.

The Biodiversity Indicator

Bats occupy a large range of habitats worldwide meaning they can act as indicators of the state of their local environment. The threats bats face are shared by many other wildlife species, showing us the collective state of our wildlife!
